Cyber-Physical Systems

Modeling Physical Dynamics

UNIVERSITY AT ALBANY State University of New York

ICEN 553/453 – Fall 2018

Prof. Dola Saha

Modeling Techniques

- Models that are abstractions of system dynamics (how system behavior changes over time)
- Modeling physical phenomena differential equations
- Feedback control systems time-domain modeling
- Modeling modal behavior FSMs, hybrid automata, …
- Modeling sensors and actuators –calibration, noise, …
- Hardware and software concurrency, timing, power, …
- Networks latencies, error rates, packet losses, …

Modeling of Continuous Dynamics

Ordinary differential equations, Laplace transforms, feedback control models, ...

Example CPS System: Helicopter Dynamics

Modeling Physical Motion

- Six Degrees of Freedom
 - Position: x, y, z
 - Orientation: pitch, yaw, roll

Notation

Position is given by three functions:

$$x \colon \mathbb{R} \to \mathbb{R}$$
$$y \colon \mathbb{R} \to \mathbb{R}$$
$$z \colon \mathbb{R} \to \mathbb{R}$$

where the domain \mathbb{R} represents time and the co-domain (range) \mathbb{R} represents position along the axis. Collecting into a vector:

 $\mathbf{x} \colon \mathbb{R} \to \mathbb{R}^3$

Position at time $t \in \mathbb{R}$ is $\mathbf{x}(t) \in \mathbb{R}^3$.

UNIVERSITY AT ALBANY Chapter 4 in <u>https://www.math.ucdavis.edu/~linear/linear-guest.pdf</u> 6

Notation

Velocity

$$\dot{\mathbf{x}} \colon \mathbb{R} \to \mathbb{R}^3$$

is the derivative, $\forall t \in \mathbb{R}$,

$$\dot{\mathbf{x}}(t) = \frac{d}{dt}\mathbf{x}(t)$$

Acceleration $\ddot{\mathbf{x}} \colon \mathbb{R} \to \mathbb{R}^3$ is the second derivative,

$$\ddot{\mathbf{x}} = \frac{d^2}{dt^2} \mathbf{x}$$

Newton's Second Law

Newton's second law states $\forall t \in \mathbb{R}$,

 $\mathbf{F}(t) = M\ddot{\mathbf{x}}(t)$

where M is the mass. To account for initial position and velocity, convert this to an integral equation

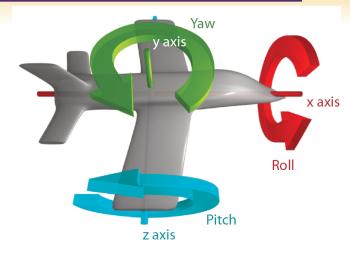

$$\mathbf{x}(t) = \mathbf{x}(0) + \int_{0}^{t} \dot{\mathbf{x}}(\tau) d\tau$$
$$= \mathbf{x}(0) + t\dot{\mathbf{x}}(0) + \frac{1}{M} \int_{0}^{t} \int_{0}^{\tau} \mathbf{F}(\alpha) d\alpha d\tau$$

Orientation

- Orientation: $\theta \colon \mathbb{R} \to \mathbb{R}^3$
- Angular velocity: $\dot{\theta} \colon \mathbb{R} \to \mathbb{R}^3$
- Angular acceleration: $\ddot{\theta} \colon \mathbb{R} \to \mathbb{R}^3$
- Torque: $\mathbf{T} \colon \mathbb{R} \to \mathbb{R}^3$

$$\theta(t) = \begin{bmatrix} \dot{\theta}_x(t) \\ \dot{\theta}_y(t) \\ \dot{\theta}_z(t) \end{bmatrix} = \begin{bmatrix} \text{roll} \\ \text{yaw} \\ \text{pitch} \end{bmatrix}$$

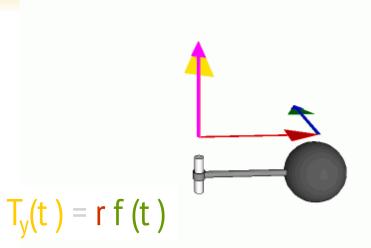

Torque: Angular version of Force

- radius of the arm: $r \in \mathbb{R}$
- force orthogonal to arm: $f \in \mathbb{R}$
- mass of the object: $m \in \mathbb{R}$

Just as force is a push or a pull, a torque is a twist. Units: newton-meters/radian, Joules/radian

angular momentum, momentum

Rotational Version of Newton's Law

$$\mathbf{T}(t) = \frac{d}{dt} \left(I(t)\dot{\theta}(t) \right),$$

where I(t) is a 3×3 matrix called the moment of inertia tensor.

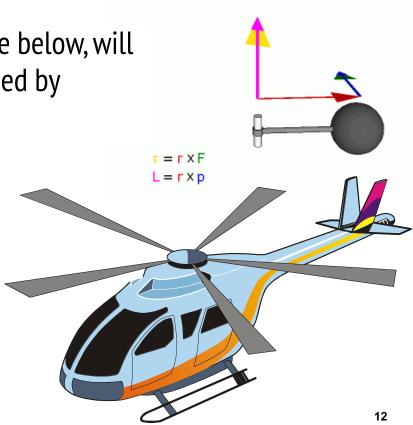

$$\begin{bmatrix} T_x(t) \\ T_y(t) \\ T_z(t) \end{bmatrix} = \frac{d}{dt} \left(\begin{bmatrix} I_{xx}(t) & I_{xy}(t) & I_{xz}(t) \\ I_{yx}(t) & I_{yy}(t) & I_{yz}(t) \\ I_{zx}(t) & I_{zy}(t) & I_{zz}(t) \end{bmatrix} \begin{bmatrix} \dot{\theta}_x(t) \\ \dot{\theta}_y(t) \\ \dot{\theta}_z(t) \end{bmatrix} \right)$$

Here, for example, $T_y(t)$ is the net torque around the y axis (which would cause changes in yaw), $I_{yx}(t)$ is the inertia that determines how acceleration around the x axis is related to torque around the y axis.

UNIVERSITY AT ALBANY <u>http://farside.ph.utexas.edu/teaching/336k/Newtonhtml/node64.html</u> 11

A helicopter without a tail rotor, like the one below, will spin uncontrollably due to the torque induced by friction in the rotor shaft.

Control system problem: Apply torque using the tail rotor to counterbalance the torque of the top rotor.

Simplified Model

Yaw dynamics:

$$T_y(t) = I_{yy}\ddot{\theta}_y(t)$$

To account for initial angular velocity, write as

$$\dot{\theta}_y(t) = \dot{\theta}_y(0) + \frac{1}{I_{yy}} \int_0^t T_y(\tau) d\tau.$$

Actor Model

- Mathematical Model of Concurrent Computation
- > Actor is an unit of computation
- Actors can
 - Create more actors
 - Send messages to other actors
 - Designate what to do with the next message
- > Multiple actors may execute at the same time

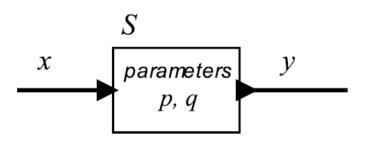

Actor Model of Systems

➤A system is a function that accepts an input signal and yields an output signal.

> The domain and range of the system function are sets of signals, which themselves are functions.

> Parameters may affect the definition of the function *S*.

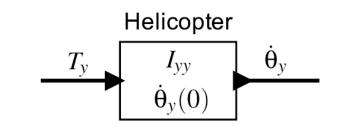

- $x: \mathbb{R} \to \mathbb{R}, \quad y: \mathbb{R} \to \mathbb{R}$
 - $S: X \to Y$

 $X = Y = (\mathbb{R} \to \mathbb{R})$

Actor Model of the Helicopter

Input is the net torque of the tail rotor and the top rotor. Output is the angular velocity around the yaxis.

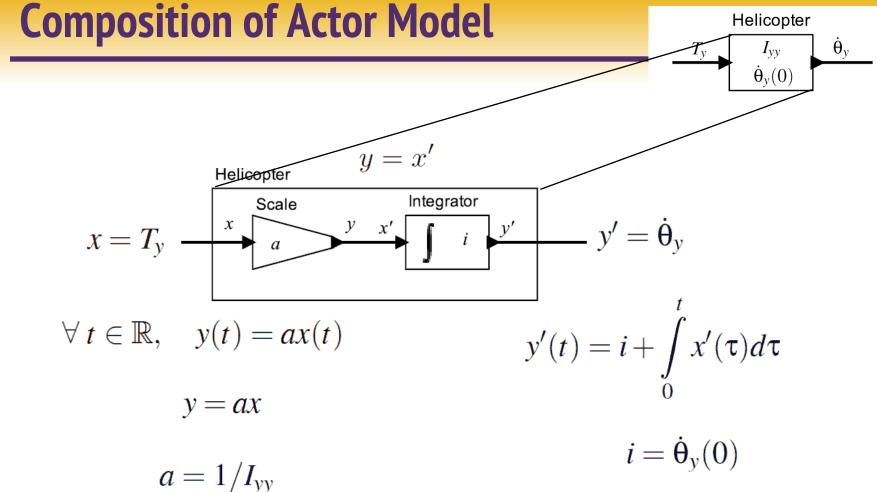

Parameters of the model are shown in the box. The input and output relation is given by the equation to the right.

UNIVERSITYATALBANY

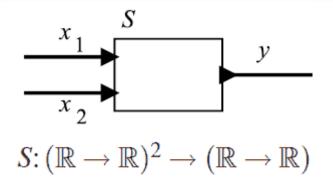

State University of New York

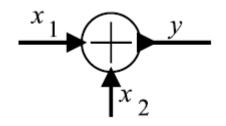

$$\dot{\theta}_y(t) = \dot{\theta}_y(0) + \frac{1}{I_{yy}} \int\limits_0^t T_y(\tau) d\tau$$

UNIVERSITY AT ALBANY

Actor Models with Multiple Inputs

 $\forall t \in \mathbb{R}, \quad y(t) = x_1(t) + x_2(t)$

 $\begin{array}{c}
x_{1} \\
y_{2} \\
x_{2} \\
(S(x_{1}, x_{2}))(t) = y(t) = x_{1}(t) - x_{2}(t)
\end{array}$

Modern Actor Based Platforms

- Simulink (The MathWorks)
- Labview (National Instruments)
- Modelica (Linkoping)
- OPNET (Opnet Technologies)
- > Polis & Metropolis (UC Berkeley)
- Gabriel, Ptolemy, and Ptolemy II (UC Berkeley)
- > OCP, open control platform (Boeing)
- GME, actor-oriented meta-modeling (Vanderbilt)

- SPW, signal processing worksystem (Cadence)
- System studio (Synopsys)
- ROOM, real-time object-oriented modeling (Rational)
- > Easy5 (Boeing)
- > Port-based objects (U of Maryland)
- > I/O automata (MIT)
- VHDL, Verilog, SystemC (Various)
