# Programming for Engineers

## Structures, Unions

UNIVERSITY  
AT ALBANY  
State University of New York

---

ICEN 200– Spring 2017

Prof. Dola Saha

# Structure

- Collections of related variables under one name.
- Variables of may be of different data types.

➤ **struct** card {  
    **char** \*face;  
    **char** \*suit;  
};

```
graph LR; Tag[Tag] --> S{ }; S --- Members[Members]; S --- face["char *face;"]; S --- suit["char *suit;"]; S --- semicolon["};"];
```

- Keyword **struct** introduces the structure definition.
- Members of the same structure type must have unique names, but two different structure types may contain members of the same name without conflict.

# Structure Declaration

---

- ```
struct employee {  
    char firstName[20];  
    char lastName[20];  
    unsigned int age;  
    char gender;  
    double hourlySalary;  
};
```
- ```
struct employee employee1, employee2;
```
- ```
struct employee employees[100];
```
- ```
struct employee {  
    char firstName[20];  
    char lastName[20];  
    unsigned int age;  
    char gender;  
    double hourlySalary;  
} employee1, employee2, *employeePtr;
```

# Structure Tag

---

- The structure tag name is optional.
- If a structure definition does not contain a structure tag name, variables of the structure type may be declared *only* in the structure definition – *not* in a separate declaration.

# Self Reference

---

- *A structure cannot contain an instance of itself.*
- A variable of type `struct employee` cannot be declared in the definition for `struct employee`.
- A pointer to `struct employee`, may be included.
- For example,
  - ```
struct employee2 {  
    char firstName[20];  
    char lastName[20];  
    unsigned int age;  
    char gender;  
    double hourlySalary;  
    struct employee2 person; // ERROR  
    struct employee2 *ePtr; // pointer  
};
```
- `struct employee2` contains an instance of itself (`person`), which is an error.

# Storage in Memory

---

- Structures *may not* be compared using operators == and !=, because
  - structure members are *not necessarily stored in consecutive bytes of memory*.
- Computers may store specific data types only on certain memory boundaries such as half-word, word or double-word boundaries.
- A word is a standard memory unit used to store data in a computer—usually 2 bytes or 4 bytes.

# Storage in Memory

```
➤ struct example {  
    char c;  
    int i;  
} sample1, sample2;
```

Possible storage, but machine dependant

# Initialization

---

- **struct** card {  
    **char** \*face;  
    **char** \*suit;  
};
- **struct** card aCard = {"Three", "Hearts"};
- If there are fewer initializers in the list than members in the structure,
  - the remaining members are automatically initialized to 0
  - or NULL if the member is a pointer.
- Assignment Statement of same struct type
  - **struct** card aCard1 = aCard2;

# Accessing Structure Members

---

- the **structure member operator** (`.`)—also called the **dot operator**
  - `printf("%s", aCard.suit); // displays Hearts`
- the **structure pointer operator** (`->`)—also called the **arrow operator**.
  - `cardPtr = &aCard;`
  - `printf("%s", cardPtr->suit); // displays Hearts`
  - Following are equivalent
    - `cardPtr->suit`
    - `(*cardPtr).suit`

# Example

```
4  #include <stdio.h>
5
6  // card structure definition
7  struct card {
8      char *face; // define pointer face
9      char *suit; // define pointer suit
10 };
11
12 int main(void)
13 {
14     struct card aCard; // define one struct card variable
15
16     // place strings into aCard
17     aCard.face = "Ace";
18     aCard.suit = "Spades";
19
20     struct card *cardPtr = &aCard; // assign address of aCard to cardPtr
21
22     printf("%s%s%s\n%s%s%s\n%s%s%s\n", aCard.face, " of ", aCard.suit,
23           cardPtr->face, " of ", cardPtr->suit,
24           (*cardPtr).face, " of ", (*cardPtr).suit);
25 }
```

Ace of Spades  
Ace of Spades  
Ace of Spades

# Structure with Function

---

- Structures may be passed to functions by
  - passing individual structure members
  - by passing an entire structure
  - by passing a pointer to a structure.
- Functions can return
  - individual structure members
  - an entire structure
  - a pointer to a structure

# typedef

---

- The keyword **typedef** is a way to create synonyms (or aliases) for previously defined data types.
- Names for structure types are often defined with **typedef** to create shorter type names.
- Example:
  - **typedef struct** card **Card**;  
Card is a synonym for type **struct card**.
- Example:
  - **typedef struct** {  
    **char** \***face**;  
    **char** \***suit**;  
} **Card**;  
▪ **Card** myCard, \*myCardPtr, deck[52];

# Card Shuffling Example (1)

```
1 // Fig. 10.3: fig10_03.c
2 // Card shuffling and dealing program using structures
3 #include <stdio.h>
4 #include <stdlib.h>
5 #include <time.h>
6
7 #define CARDS 52
8 #define FACES 13
9
10 // card structure definition
11 struct card {
12     const char *face; // define pointer face
13     const char *suit; // define pointer suit
14 };
15
16 typedef struct card Card; // new type name for struct card
17
18 // prototypes
19 void fillDeck(Card * const wDeck, const char * wFace[],
20     const char * wSuit[]);
21 void shuffle(Card * const wDeck);
22 void deal(const Card * const wDeck);
23
```

# Card Shuffling Example (2)

---

```
24 int main(void)
25 {
26     Card deck[CARDS]; // define array of Cards
27
28     // initialize array of pointers
29     const char *face[] = { "Ace", "Deuce", "Three", "Four", "Five",
30         "Six", "Seven", "Eight", "Nine", "Ten",
31         "Jack", "Queen", "King"};
32
33     // initialize array of pointers
34     const char *suit[] = { "Hearts", "Diamonds", "Clubs", "Spades"};
35
36     srand(time(NULL)); // randomize
37
38     fillDeck(deck, face, suit); // load the deck with Cards
39     shuffle(deck); // put Cards in random order
40     deal(deck); // deal all 52 Cards
41 }
42
```

# Card Shuffling Example (3)

```
43 // place strings into Card structures
44 void fillDeck(Card * const wDeck, const char * wFace[],
45             const char * wSuit[])
46 {
47     // loop through wDeck
48     for (size_t i = 0; i < CARDS; ++i) {
49         wDeck[i].face = wFace[i % FACES];
50         wDeck[i].suit = wSuit[i / FACES];
51     }
52 }
53
54 // shuffle cards
55 void shuffle(Card * const wDeck)
56 {
57     // loop through wDeck randomly swapping Cards
58     for (size_t i = 0; i < CARDS; ++i) {
59         size_t j = rand() % CARDS;
60         Card temp = wDeck[i];
61         wDeck[i] = wDeck[j];
62         wDeck[j] = temp;
63     }
64 }
65
```

# Card Shuffling Example (4)

---

```
66 // deal cards
67 void deal(const Card * const wDeck)
68 {
69     // loop through wDeck
70     for (size_t i = 0; i < CARDS; ++i) {
71         printf("%5s of %-8s%s", wDeck[i].face , wDeck[i].suit ,
72             (i + 1) % 4 ? " " : "\n");
73     }
74 }
```

---

# Card Shuffling Example (5)

# Structure nested within another structure

```
struct customer {
    char lastName[ 15 ];
    char firstName[ 15 ];
    unsigned int customerNumber;

    struct {
        char phoneNumber[ 11 ];
        char address[ 50 ];
        char city[ 15 ];
        char state[ 3 ];
        char zipCode[ 6 ];
    } personal;
} customerRecord, *customerPtr;

customerPtr = &customerRecord;
```

# Union

---

- A **union** is a *derived data type*—like a structure—with members that *share the same storage space*.
- For different situations in a program, some variables may not be relevant, but other variables are—so a union shares the space instead of wasting storage on variables that are not being used.
- The members of a union can be of **any data type**.
- The number of bytes used to store a union must be at least **enough to hold the *largest* member**.

# Definition

---

- **union** number {  
    **int** x;  
    **double** y;  
};
- In a declaration, *a union may be initialized with a value of the same type as the first union member.*
- **union** number value = {**10**};
- **union** number value = {**1.43**}; // ERROR

# Permitted Operations

---

- The operations that can be performed on a union are:
  - assigning a union to another union of the same type,
  - taking the address (&) of a union variable,
  - and accessing union members using the structure member operator and the structure pointer operator.
- Unions may not be compared using operators == and != for the same reasons that structures cannot be compared.

# Union Example (1)

```
1 // Fig. 10.5: fig10_05.c
2 // Displaying the value of a union in both member data types
3 #include <stdio.h>
4
5 // number union definition
6 union number {
7     int x;
8     double y;
9 };
10
11 int main(void)
12 {
13     union number value; // define union variable
14
15     value.x = 100; // put an integer into the union
16     printf("%s\n%s\n%s\n %d\n\n%s\n %f\n\n\n",
17           "Put 100 in the integer member",
18           "and print both members.",
19           "int:", value.x,
20           "double:", value.y);
```

# Union Use Case

typedef union

```
{  
    int wears_wig;  
    char color[20];  
} hair_t;
```

FIGURE 10.14 Function That Displays a Structure with a Union Type Component

```
1. void  
2. print_hair_info(hair_info_t hair) /* input - structure to display */  
3. {  
4.     if (hair.bald) {  
5.         printf("Subject is bald");  
6.         if (hair.h.wears_wig)  
7.             printf(", but wears a wig.\n");  
8.         else  
9.             printf(" and does not wear a wig.\n");  
10.    } else {  
11.        printf("Subject's hair color is %s.\n", hair.h.color);  
12.    }  
13. }
```

142. /* Code for compute_perim and print_figure goes here */
```

# Enumeration

---

- Keyword `enum`, is a set of integer **enumeration constants** represented by identifiers.
- Values in an enum start with 0, unless specified otherwise, and are incremented by 1.
- For example, the enumeration

- `enum months {  
    JAN, FEB, MAR, APR, MAY, JUN, JUL, AUG, SEP,  
    OCT, NOV, DEC};`

creates a new type, `enum months`, identifiers are set to the integers 0 to 11, respectively.

- Example:

- `enum months {  
    JAN = 1, FEB, MAR, APR, MAY, JUN, JUL, AUG,  
    SEP, OCT, NOV, DEC};`

identifiers are set to integers 1 to 12, respectively.

# Enumeration Example

```
1 // Fig. 10.18: fig10_18.c
2 // Using an enumeration
3 #include <stdio.h>
4
5 // enumeration constants represent months of the year
6 enum months {
7     JAN = 1, FEB, MAR, APR, MAY, JUN, JUL, AUG, SEP, OCT, NOV, DEC
8 };
9
10 int main(void)
11 {
12     // initialize array of pointers
13     const char *monthName[] = { "", "January", "February", "March",
14         "April", "May", "June", "July", "August", "September", "October",
15         "November", "December" };
16
17     // loop through months
18     for (enum months month = JAN; month <= DEC; ++month) {
19         printf("%2d%11s\n", month, monthName[month]);
20     }
21 }
```

# Enumeration Example Output

---

- 1 January
- 2 February
- 3 March
- 4 April
- 5 May
- 6 June
- 7 July
- 8 August
- 9 September
- 10 October
- 11 November
- 12 December

# Enumerated Data Example

```
1 #include <stdio.h>
2
3 int
4 main( int number_of_args, char* arg_list[] )
5 {
6     enum Security_Levels
7     {
8         black_ops,
9         top_secret,
10        secret,
11        non_secret
12    };
13
14    enum Security_Levels my_security_level = top_secret;
15
16    if ( my_security_level == black_ops )
17    {
18        printf("You have top level security.\n");
19        printf("Opening door and unlocking the machine for you\n");
20    }
21    else if ( my_security_level == top_secret )
22    {
23        printf("You have top level security, opening the door for you\n");
24    }
25    else if ( my_security_level == secret )
26    {
27        printf("You don't have enough security clearance. Please leave Now\n");
28    }
29    else if ( my_security_level == non_secret )
30    {
31        printf("You do not have security clearance\n");
32        printf("Warning, The Police have been Called\n");
33        printf("Surrender yourself to them immediately!\n");
34    }
35
36    return 0;
37 }
```
