Hunter (Univ. of Lethbridge, Canada) has compiled a collection of 165 articles that were published in IGI Global imprints between 2006 and 2009. The contents of the four volumes are divided into eight subject categories: fundamental concepts and theories (28 articles); development and design methodologies (26 articles); tools and technologies (22 articles); utilization and application (22 articles); organizational and social implications (24 articles); managerial impact (12 articles); critical issues (16 articles); and emerging trends (15 articles). Most of the articles are written from a business or management perspective, but some cover aspects of health care, finance, military operations, government, and education. Coming from academic and corporate experts from around the world, the articles are generally well written; however, some appear to be poorly edited. Access to the entire set is provided by complete tables of contents and subject indexes that are in all volumes. However, the 18-page index is skimpy for a publication of this size. An author listing appears near the beginning of each volume. In addition to the print publication, the publisher offers online-only access and online-plus-print options. The online version, which should provide additional access points, was not available to this reviewer. This set will be useful for institutions that are developing research collections in management information systems or strategic planning, and that do not have access to IGI Global's publications. Summing Up: Recommended. Upper-level undergraduates through professionals/practitioners. -- M. Knee, University at Albany, SUNY
